First we create a database (in my computer I create hoda database) on pgAdmin then open visual studio and open the file of project. our project has a file which named database.py , open it . in line 13 paste the address of project which saved in out pc. Then we run it, the database connection closed.

In pgadmin, refresh the database ,2 table were added .

open flask.py and then we run it after that in dash_app.py , in line 140, paste the path of map.html.

Open a new terminal and install dash. Then type python C:\Users\sana\Desktop\Hoda\hoda\Dash_app.py

(the path of dash file).
